Ernesto Gomez

Abstract

Cloud computing is one area of computer science that is gaining popularity among the business community and population as a whole. As more and more companies adopt it, there is the question of whether traditional security measures are enough or more is needed. This independent study looks at the cloud concept while delving into its security concerns such as infrastructure, data, and identity and access management. It also looks at how present privacy laws are keeping up with the cloud; and concludes by looking at the future of the cloud concept.
