Title

A Development Solution for Managing a Bank's Loan Portfolio

Student

David Bowman

Advisor

Dr. David Turner

Abstract

This solution implements a SQL database with a Visual Basic.net front end to assist in the management and underwriting of loans for the bank. The primary portions of this solution are an objective loan grading system, a system to aid loan origination, and a reporting system. The objective loan grading system helps determine the quality of current or potential credits. The loan origination system interacts between the database and the user, to store and analyze the loans information. The reporting system automatically generates a number of daily reports used by the bank.
