Title

Microsoft System Center Configuration Manager (SCCM) in Home Use

Student

Kevin de la Cueva

Advisor

Dr. David Turner

Abstract

I will present my home server I repurposed showing Microsoft's System Center Configuration Manager (SCCM). SCCM is one of the leading software for managing large groups of computers in an organization. It is used in collecting and pushing content such as updates, patches, software, and operating systems. Some other uses are remote control, network access protection, and hardware and software inventory. What I will be focusing on the setup and use of SCCM, and how it can be used in both a home environment, and how it is used in my office environment.
